

Virtual FISART & the Social Media Network

This system is based of large amount of photo images. We decided to use one of the most advanced photo management system available for the time being on the Internet and known as “[Google Photos](#)”, best described as follows: “*Google Photos is a cloud photo storage service provided by Google. That means your photos have the same security and simplicity enjoyed by other Google services. Due to this simplicity, we recommend it for anyone from youngsters to curious seniors. Google has an excellent AI based image recognition engine behind Google Photos. As a result, they can determine what is on your photos and label it accordingly. This means you can instantly search for your photos by just describing what you need to find. This service is also great if you take a ton of your photos using your Android device and wants to [automatically backup all your photos](#) for free. With Google’s reputation, this is probably one of the safest photography websites in the world (the source of this description may be found in the next link bellow).*”

Google Photos can be used for free and we encourage all participating artists and partners to use it for a better communication and image transfer. For the dissemination and promotion of their own photos which appear on the Virtual FISART system the artists and partners may use the image related products (as those presented here: [Popular Photo Sharing Sites to Share Your Photos](#)) and Social Media platforms for **Photo Sharing, Portfolio Presentations, Storage, Image Hosting and Image Transfer.**
